

Root Zone Excavation

Supersonic air tools are state-of-the-art excavation tools that are revolutionizing the arboricultural industry. These tools use great volumes of compressed air to remove and break up soil, even hard clay, without damaging roots, cables or buried utility lines.

Reveal the Root of the Problem

The focused air stream cuts through soil quickly and with great accuracy in considerably less time than conventional digging, allowing for more efficient service.

Problems with roots and soil often lead to plant failure. This powerful hand held device safely exposes root systems, allowing for more effective treatments and diagnoses than were available in the past. These tools are also important for developing more precise long term care plans.

Root zone excavation can accurately reveal the cause of declining plant health in an otherwise healthy row of trees or shrubs

Giving Arborists the Cutting Edge in Landscape Management

- Immediate visual inspection and correction of specific plant health concerns
- Quick, accurate diagnosis of plant diseases and the extent of decay without extensive root system damage
- One step aeration and soil replacement to reduce soil compaction
- Trench with minimum disturbance of roots during utility or construction projects
- Facilitates application of specially blended materials to promote root growth and survival rate
